Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
Nacetylgalactosamine-4-sulfatase (EC 3.1.6.12) precursor - rat (fragment)
N.Alternate names: arylsulfatase (EC 3.1.6.1) B [misidentification]
C.Species: Rattus norvegicus (Norway rat)
C.Sate: 12-Aug-1996 #sequence_revision 12-Aug-1996 #text_change 02-Jun-2000
C.Accession: 154210
R.Kunieda, T.
Genomics 29, 582-587, 1995
A.Title: Mucopolysaccharidosis type VI in rats: Isolation of cDNAs encoding arylsulfa A; Reference number: 154210; MUD:96121368
A.Tette: Mucopolysaccharidosis type VI in rats: Isolation of cDNAs encoding arylsulfa A; Reference number: 154210
A; Reference number: 154210
A; Restques: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Residues: 1-473 <RES>
A; Cross-references: GB:D49434; NID:91065603; PIDN:BAA08412.1; PID:91089794
C; Genetics:
A; Gene ARSB
C; Superfamily: animal sulfatase
C; Keywords: sulfuric ester hydrolase
F; 31/Modified site: 3-oxoalanine (Cys) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

A; Title: Feline arylsulfatase B (ARSB): isolation and expression of the cDNA, compari
A; Reference number: A44475
A; Accession: A44475
A; Status: preliminary; not compared with conceptual translation
A; Molecule type: mRNA
A; Residues: 1-535 <JAC>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Villani G.R.D., Balzano N., di Natale P.;

"Two novel mutations of the arylsulfatase B gene in two Italian patients with severe form of mucopolysaccharidosis.";

Hum. Mutat. 11:410-410(1998).

-!- CATALYTIC ACTIVITY: Hydrolysis of the 4-sulfate groups of the Nacetyl-D-galactosamine 4-sulfate units of chondroitin sulfate and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SYNDROME; ALSO KNOWN AS MUCOPOLYSACCHARDOSIS TYPE UT (MPS-VI).

THIS DISEASE IS CHARACTERIZED BY THE ACCUMULATION OF DERWATAN
SULFATE IN LYSOSOMES. CLINICAL FEATURES CAN INCLUDE ABROATAN
GROWTH, SHORT STATURE, STIFF JOINTS, SKELETAL MALFORMATIONS,
CORNEAL CLOUDING, HEPATOSPLENOMEGALY, AND CARDIAC ABNORMALITIES.

M WIDE WARRATION IN CLINICAL SEVERITY IS OBSERVED.

DISEASE: MULTIPLE SULFATASE DEFICIENCY (MSD) IS A DISORDER THAT
COMBINES FEATURES OF METACHROMATIC LEUKODYSTROPHY AND OF
MUCOPOLYSACCHARIDOSIS; IT IS CHARACTERIZED BY A DECREASED
ACTIVITY OF ALL KNOWN SULFATASES. IT SEEMS TO BE CAUSED FROM THE
LACK OF POST-TRANSLATIONAL MODIFICATION OF A CYSTEINE INTO 2-
AMINO-3-OXOPROPIONIC ACID.
                                                              Jin W.-D., Jackson C.E., Desnick R.J., Schuchman E.H.; "Mucopolysaccharidosis type VI: identification of three mutations in the arylsulfatase B gene of patients with the severe and mild phenotypes provides molecular evidence for genetic heterogeneity."; Am. J. Hum. Genet. 50:795-800(1992).
                                                                                                                                                                                                                            "Mucopolysaccharidosis VI (Maroteaux-Lamy syndrome). Arylsulfatase B precursor (EC 3.1.5.12) (ASB) (N-acetylgalactosamine-
                                                                                                                                                                                                                                                                                                                                                                                                                                 "Feline arylsuifatase B (ARSB): isolation and expression of the CDNA, comparison with human ARSB, and gene localization to feline chromosome Al.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -:- SUBUNIT: HOMODIMER.
-:- SUBCELLULAR LOCATION: Lysosomal.
-:- SUBCELLULAR LOCATION: Lysosomal.
-:- DISEBARE: DEFECTS IN ARSB ARE THE CAUSE OF MAROTEAUX-LAMY
SYNDROME; ALSO KNOWN AS MUCOPOLYSACCHARIDOSIS TYPE VI (MPS-VI).
MPS-VI HAS BEEN DESCRIBED IN SIAMESE CATS.
-:- SIMILARITY: BELONGS TO THE SULFATASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                             MEDLINE-93052342; PubMed-1427856;

"Structure of sea-urchin arylsulfatase gene.";
Eur. J. Blochem. 186:405-410(1989).
-!- FUNCTION: MAY BE A STRUCTURAL COMPONENT OF THE EXTRACELLULAR MATRICES INVOLVED IN CELL MOYBENT DURING MORPHOGENESIS.
-!- CATALYTIC ACTIVITY: A phenol sulfate + H(2)0 = a phenol + sulfate.
-!- SUBCELLULAR LOCATION: IN BOTH THE CYTOPLASM AND THE EXTRACELLULAR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Strongylocentrotus purpuratus (Purple sea urchin).

-!- CARALYTIC ACTIVITY: A phenol sulfate + H(2)0 = a phenol + sulfate.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: EXPRESSION IS CONFINED TO ABORAL ECTODERM
                                                                                                                                                                                                                             CELLS AND THEIR PRECURSORS.

DEVELOPMENTAL STAGE: LOW LEVELS ARE FOUND AT MESENCHYME BLASTULA STAGE (24 HR), LEVELS INCREASE BY LATE GASTRULA STAGE AND ARE MAINTAINED AT PLUTEUS STAGE.

SIMILARITY: BELONGS TO THE SULFATASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                             A_Geneseq_032802:*

                                               cerebrovascular diseases, infections such as acute meningitis, demyelinating diseases including multiple sclerosis, degenerative diseases affecting the cerebral cortex including Alzheimer's disease and Pick disease, spinocerebellar degenerations including spinocerebellar ataxias including Friedreich ataxia, and ataxia telangiectasia, degenerative diseases affecting motor neurons including amyotrophic lateral sclerosis, inborn errors of metabolism such as leukodystrophics, toxic and acquired metabolic diseases, including vitamin deficiencies, and neurocutaneous syndromes (phakamatoses) including neurofibromotosis. The present sequence represents a human 23553 sulfatase polypeptide.

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of the reatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, treatened hasorders, regenerating borne, cartilage, tendon, ilyament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthitis, anaemia, hisheimer's, parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, graft-versus-host diseases, nervous system diseases, and infection.

The present sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target during to a tumour, in assays to determine biological activity, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      raise antibodies/elicit an immore response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, Altheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral
Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; secreted protein; transmembrane protein; PRO; EST; cytostatic; expressed sequence tag; detection; cancer.
                                              The present invention describes secreted and transmembrane polypeptid and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generatio of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ34338, and AAY41685 to AAY4174 represent polynucleotide and polypeptide sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PRO polypeptide; manmal; tumour; cancer; human; cattle; horse; sheep; dog; cat; pig; goat; rabbit; tumour necrosis factor alpha; TNF-alpha; blood; chondrocyte cell; cell proliferation; cell differentiation; colon; adrenal; lung; breast; prostate; rectum; cervix; liver; genetic disorder.
                                                                                                                                                                                                                                                                                sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polypeptides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting and be used to Aill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in the isolation of the PRO polynucleotide.sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel PRO polypeptides and polynucleotides used in detection methods, to target bloactive molecules to specific cells, and to modulate cellular activities -

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals and to screen for modulators of the compounds -

the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.

CC AAH99166 to AAH99904 encode the human proteins given in AAM25255 to CAAM25963. The proteins can have activities based on the tissues and cells they are expressed in, such activities based on the tissues and cells they are expressed in, such activities based on the tissues and cells they are expressed in, such activities antinflammatory; antirheumatic; contrain nervous system; virucide; anti-HV; fungicide; antimutagen; cardiovascular; antianaemic; antiadegregant; haemostatic; vulnerary; antiulcer; osteopathic; dermatological; antiallergic; antiasthmatic; antiparkinsonian; and immunostimulant. The proteins and polynucleotides cording them can be used in gene therapy, antisense therapy and vaccine conding them can be used in gene therapy, antisense therapy and vaccine condition; The proteins and polynucleotides are useful for screening for aponists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatold arthritis, septic shock, pancreatitis, cardiac dysfunction, rheumatold arthritis, severe combined immunodeficiency, eczenn inflammation, autoimmunity, genetic diseases, haematopoietic disorders, anematoporosis, severe combined immunodeficiency, eczenn allergic chinitis, asthma, diabetes, cancer, multiple sclerosis, depression, contrological disorders, neurodegenerative and contrological disease, neurodegenerative and contrological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. athhills), meurological disorders (e.g. Alzhamatory disorders (e.g. athhills), neurological disorders (e.g. atheroselers), ce.g. athhills), neurological disorders (e.g. atheroselers), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atheroselerosis), blood related disorders (e.g. hemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynucleotides of the invention can also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                      the printed
                 preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous
                                                                                                                                                                                                                                                                                                                                                                                  e: The sequence data for this patent did not form part of the printer scification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences.

                                                                                             The invention provides 22438, 23533, 25278 or 26212 human sulfatase polypeptides and polynucleotides. The sulfatase genes and polypeptides are useful for treating disorders involving the brain such as cerebrovascular diseases, infections such as acute meningitis, demyelinating diseases including multiple sclerosis, degenerative diseases affecting the cerebral cortex including Alaheimer's disease and Pick diseases, spinocerebellar degenerations including spinocerebellar ataxias including Friedreich ataxia, and ataxia telangiectasia, degenerative diseases affecting motor neurons including amyotrophic lateral sclerosis, inborn errors of metabolism such as leukodystrophies, toxic and acquired metabolic diseases, including vitamin deficiencies, and neurocutaneous syndromes (phakamatoses) including neurofibromotosis. The present sequence represents a human 25278 sulfatase polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a recombinant human iduronate 2-sulfatase
Novel human sulfatase polypeptides useful for treating and diagnosing sulfatase-related disorders such as cerebrovascular diseases, acute meningitis, multiple sclerosis, degenerative diseases and tumor
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New highly glycosylated recombinant human iduronate 2-sulfatase useful for diagnosing or treating subjects suspected of having o suffering from IDS deficiency disorders, e.g. Hunter syndrome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
(IDS). The recombinant IDS is more highly glycosylated than the naturally
             occurring enzyme isolated from human 11ssue. The recombinant human TDS can be produced in Chinese Hamster Ovary (CHO) cells or in a human cell. The recombinant IDS comprises a fusion protein. It is a mucopolysaccharidosis inhibitor and can be used in gene therapy. The recombinant IDS is useful in treating and diagnosing subjects suffering from or suspected of having IDS deficiency disorders, e.g. Hunter syndrome (mucopolysaccharidosis type II). The present sequence represents a human sulfatase which is used in comparison with the IDS sequence in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                            Gaps

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella neumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to indentify proteins used in proliferation, to expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

TIDS). The recombinant IDS is more highly glycosylated than the naturally occurring enzyme isolated from human tissue. The recombinant human IDS occurring enzyme isolated from human tissue. The recombinant human IDS or an be produced in Chinese Hamster Ovary (CHO) cells or in a human IDS. The recombinant IDS comprises a fusion protein. It is a mucopolysaccharidosis inhibitor and can be used in gene therapy. The recombinant IDS is useful in treating and diagnosing subjects suffering from or suspected of having IDS deficiency disorders, e.g. Hunter syndrome (mucopolysaccharidosis type II). The present sequence represents a sea urchin sulfatase which is used in comparison with the IDS sequence in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present invention describes a recombinant human iduronate 2-sulfatase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New highly glycosylated recombinant human iduronate 2-sulfatase (IDS) useful for diagnosing or treating subjects suspected of having or suffering from IDS deficiency disorders, e.g. Hunter syndrome
                                                                                                                                                                         Human; iduronate 2-sulfatase; IDS; glycosylated; gene therapy; mucopolysaccharidosis inhibitor; IDS deficiency disorder; Hunter syndrome; mucopolysaccharidosis type II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 551;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drosophila melanogaster polypeptide SEQ ID NO 16530.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequences (ABLO1840-ABL16175) and the encoded proteins (ABB7737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions - \,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description

acute

and

treating

The invention provides 22438, 23553, 25278 or 26212 human sulfatase polypeptides and polynucleotides. The sulfatase genes and polypeptides are useful for treating disorders involving the brain such as cerebrovascular diseases, infections such as acute meningitis, demyelinating diseases including multiple sclerosis, degenerative diseases including multiple sclerosis, degenerative diseases sffecting the cerebral cortex including Alzheimer's disease and Pick disease, spinocerebellar degenerations including spinocerebellar ataxias including Friedreich ataxia, and ataxia telangiectasia, degenerative diseases affecting motor neurons including amyotrophic lateral sclerosis, inborn errors of metabolism such as leukodystrophies, toxic and acquired metabolic diseases, including vitamin deficiencies, and neurocutanneous syndromes (phakamatoses) including neurofibromotosis. sulfatase-related disorders such as cerebrovascular diseases, a meningitis, multiple sclerosis, degenerative diseases and tumor useful for Novel numan sulfatase polypeptides sulfatase-related disorders such as Claim 2; Fig 15; 180pp; English 2001-476214/51 P-PSDB; AAB85483 encoding

Sequences AAS45925-AAS46231 represent DNA molecules encoding and PCR primers for PRO polypeptides of the invention. The sequences of the invention can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, bigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation of differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian changed the used for genetic analysis of individuals with genetic disorders. 9999999999999999988

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAX33891 to AAX34338, and AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   secreted and transmembrane polypeptides and their polynucleotides, ful for treating blood coagulation disorders, cancers and cellular
